Food Analysis- A deep dive into food

Food and nutrition are how we obtain fuel to energize our bodies, requiring daily replenishment of essential nutrients. Mindful eating and understanding nutrition are crucial for both physical health and mental well-being. Diets rich in vegetables, fruits, and whole grains can help prevent chronic illnesses like heart disease and diabetes.

This notebook explores common foods and their nutritional profiles to highlight what fuels our bodies best.

You'll find the step-by-step guide and relevant website links at the bottom of the PDF. The original dataset is available on my GitHub: <https://github.com/AlexStcR>

```
[495]: import pandas as pd
import matplotlib.pyplot as plt

#load nutrition file
foods = pd.read_csv('nutrients_csvfile.csv')
print(foods.head())
```

| | | Food Measure | Grams | Calories | Protein | Fat | Sat.Fat | Fiber | \ |
|---|--|-----------------------|--------|----------|---------|-----|---------|-------|-----|
| 0 | | Cows' milk | 1 qt. | 976 | 660 | 32 | 40 | 36 | 0 |
| 1 | | Milk skim | 1 qt. | 984 | 360 | 36 | t | t | 0 |
| 2 | | Buttermilk | 1 cup | 246 | 127 | 9 | 5 | 4 | 0 |

Conclusion

Key Findings:

Protein: Meat/seafood > dairy > breads/cereals.

Carbs: Breads/cereals > sweets > vegetables.

Fat: Seeds/nuts > dairy > meats.

Saturated Fat: Dairy > processed foods > meats.

Dietary Observations:

Highlighted nutrient-dense vs. calorie-dense foods.

Compared saturated fat content across categories.

#https://plotly.com/graphing-libraries/  
#https://www.w3schools.com/python/matplotlib_pyplot.asp
```

Find the step-by-step process below.

```
[ ]: '''  
1. Data Loading & Initial Inspection  
File Import: Loaded nutrients_csvnile.csv using pd.read_csv().  
  
Head Preview: Displayed the first 5 rows to understand the structure  
  
2. Data Cleaning  
Missing Values:  
  
Identified NaN values with isnull().sum().  
  
Filled missing values using fillna(0).  
  
Placeholder Handling:  
  
Replaced "t" (trace amounts) and "a" (erroneous entry) with 0.  
  
Removed commas from numeric fields (e.g., 1,419 → 1419).  
  
Type Conversion:  
  
Converted columns (Grams, Calories, etc.) to numeric using pd.to_numeric().  
  
Dropped rows with residual NaN values after cleaning.  
  
3. Data Standardization  
Normalization:  
  
Created a scaling_factor = 100 / Grams to standardize all nutritional values to  
→ per 100g.
```

Scaled Calories, Protein, Fat, and Carbs using this factor.

Updated Measure to "100g" and Grams to 100 for consistency.

Text Formatting:

Lowercased Food and Category columns for uniformity.

4. Exploratory Data Analysis (EDA)

*Category Filtering: Extracted specific food groups (e.g., vegetables, seeds,
 ↪dairy)*

Nutrient Ranking:

Visualization:

*Created 3D scatter plots (Carbs vs. Fat vs. Calories) for categories like meat,
 ↪breads, and dairy.*

Generated bar charts for top protein/fat sources.

Built pie charts to show macronutrient distribution across categories

Sorted foods by protein/fat/carb content to identify top sources

5. Insights & Conclusions

Key Findings:

Protein: Meat/seafood > dairy > breads/cereals.

Carbs: Breads/cereals > sweets > vegetables.

Fat: Seeds/nuts > dairy > meats.

Saturated Fat: Dairy > processed foods > meats.

Dietary Observations:

Highlighted nutrient-dense vs. calorie-dense foods.

Compared saturated fat content across categories.

Key Tools Used

Pandas: Data manipulation (filtering, scaling, type conversion).

Plotly: Interactive 3D plots (px.scatter_3d), bar/pie charts.

Seaborn/Matplotlib: Supplementary visualization.

*This process transformed raw, messy data into actionable insights about ↵
↵macronutrient distribution across food groups. '''*
